## Drytronic-Revolution at the Herodion

The Ladies "Royal Chambers" built by Herod the Great for the anticipated visit of Marcus Agrippa in 15 BC (and Tiberius) is now saved from destructive moisture and whatever came with it.

On the slope of the Herodium mountain, in sight of Bethlehem, the developer and consultant in heritage preservation, Christoph Schmidt, was able to dry the Frescoes and walls, due to his electrochemical processes that are a real revolution - they said- in the future, for heritage preservation.

With the Drytronic moisture control system, including a unique graphite enhanced mortar, etc. it was possible to automatically remove the moisture from substances. On the hardened structure the colors came out bright again. What could not be achieved with classical methods is now available not only for heritage sites, but for anyone in need, in a simple and affordable way. Drytronic systems in the tradition of swabian entrepreneurship are now available for use to anyone around the globe.
